inverse scattering problems and their applications to nonlinear integrable equations second edition is devoted to inverse scattering problems isps for differential equations and their applications to nonlinear evolution equations nlees the book is suitable for anyone who has a mathematical background and interest in functional analysis differential equations and equations of mathematical physics this book is intended for a wide community working with isps and their applications there is an especially strong traditional community in mathematical physics in this monograph the problems are presented step by step and detailed proofs are given for considered problems to make the topics more accessible for students who are approaching them for the first time new to the second edition all new chapter dealing with the bäcklund transformations between a common solution of both linear equations in the lax pair and the solution of the associated ibvp for nlees on the half line updated references and concluding remarks features solving the direct and isp then solving the associated initial value problem ivp or initial boundary value problem ibvp for nlees are carried out step by step the unknown boundary values are calculated with the help of the lax generalized equations then the time dependent scattering data sd are expressed in terms of preassigned initial and boundary conditions thereby the potential functions are recovered uniquely in terms of the

given initial and calculated boundary conditions the unique solvability of the isp is proved and the sd of the scattering problem is described completely the considered isps are well solved the isps are set up appropriately for constructing the bäckhund transformations bts for solutions of associated ibvps or ivps for nlees the procedure for finding a bt for the ibvp for nlees on the half line differs from the one used for obtaining a bt for non linear differential equations defined in the whole space the interrelations between the isps and the constructed bts are established to become new powerful unified transformations uts for solving ibvps or ivps for nlees that can be used in different areas of physics and mechanics the application of the uts is consistent and efficiently embedded in the scheme of the associated isp

in the modern theory of boundary value problems the following ap proach to investigation is agreed upon we call it the functional approach some functional spaces are chosen the statements of boundary value prob the basis of these spaces and the solvability of lems are formulated on the problems properties of solutions and their dependence on the original data of the problems are analyzed these stages are put on the basis of the correct statement of different problems of mathematical physics or of the definition of ill posed problems for example if the solvability of a prob lem in the functional spaces chosen cannot be established then probably the reason is in their unsatisfactory choice then the analysis should be repeated employing other functional spaces elliptical problems can serve as an example of classical problems which are analyzed by this approach their investigations brought a number

of new notions and results in the theory of sobolev spaces w d which in turn enabled us to create a sufficiently complete theory of solvability of elliptical equations nowadays the mathematical theory of radiative transfer problems and kinetic equations is an extensive area of modern mathematical physics it has various applications in astrophysics the theory of nuclear reactors geophysics the theory of chemical processes semiconductor theory fluid mechanics etc 25 29 31 39 40 47 52 78 83 94 98 120 124 125 135 146
